

# Plant Cycle

The illustrations below show the cycle of a bean plant. Starting from a seed, it begins building roots, then sprouts above ground and develops leaves. It finally matures into a full grown plant with seeds that are ready to start the cycle again.

Using the blank diagram on the next page, illustrate the lifecycle of another plant. You can choose any plant you'd like! Start from a seed, and try to illustrate what the plant might be doing at different stages in its lifecycle. End with the plant fully grown with new seeds to begin the cycle.
